

GOLF SWING PRACTICE DEVICE

ABSTRACT OF THE DISCLOSURE

An improved golf swing practice device is composed of a base frame, a guide
5 hoop mounted on the base frame and having a trajectory on the same plane, a guide rail
slidably mounted on the guide hoop, the guide rail being parallel to the plane that the
guide hoop is positioned and having an extending direction substantially corresponding
to the diametrical direction of the guide hoop, a slide member slidably mounted on the
guide rail, and a training golf club having a distal end pivotably mounted on a rear end
10 of the slide member to define an imaginary club head. Accordingly, the golfer can stand
behind the guide hoop and hold the training golf club to perform swing actions. A
position that the imaginary club head is positioned is controlled to move on a swing
plane, such that the present invention effectively helps the golfer to perform swing
actions.
